

FlowGuard: Supply Chain Predictive Analytics

Transforming raw data into operational efficiency.

Securing Ksh 750,000 in Annual Savings.

The Pain Point

- **Ksh 5,000,000** estimated annual inventory holding costs trapping vital capital.
- Constant stockouts on high-demand items actively eroding customer trust and revenue.
- Systematic overstocking of slow-moving inventory leading to inflated warehouse costs.
- Heavy reliance on manual, error-prone Excel forecasting creating operational blind spots.

The FlowGuard Solution

Automated Pipelines

Medallion architecture automatically extracts and cleans raw inventory data, eliminating manual entry errors entirely.

Predictive Analytics

Machine learning forecasting models predict demand spikes and optimize reorder points to prevent both stockouts and overstocking.

Executive Dashboard

Real-time KPIs delivered via a user-friendly web interface, designed specifically for procurement and C-level decision makers.

Financial Impact

400%

Projected ROI

Rapid Payback Period

The Ksh 150,000 initial investment for cloud infrastructure and setup pays for itself in just **2.4 months**.

Substantial Annual Savings

By conservatively reducing excess inventory holding costs by 15%, we unlock **Ksh 750,000** in net new operational savings every year.

Execution & Mitigation

Risk 1: Legacy Data Quality

Historical data from older internal systems may skew early forecasts.

Mitigation: Implementation of strict, automated data quality gates within the ETL workflow before data reaches the reporting layer.

Risk 2: User Adoption Resistance

Procurement teams are heavily accustomed to manual legacy processes.

Mitigation: Phased dashboard rollout with hands-on training, retaining a familiar UI layout to ease the transition.

The Recommendation: GO.

We request immediate approval for the **Ksh 150,000** deployment budget. FlowGuard pays for itself in less than 3 months and establishes a scalable foundation for all future analytics initiatives.
